

# GeoCluster

---

A Latent Variable Generative Model for  
Continuous Space Geometric Clustering

Presenter: Panagiotis Rigas

# Introduction

**GeoCluster** is a generative model that aims to partition the data space, while approximately preserving the original metric space. Applications may include:

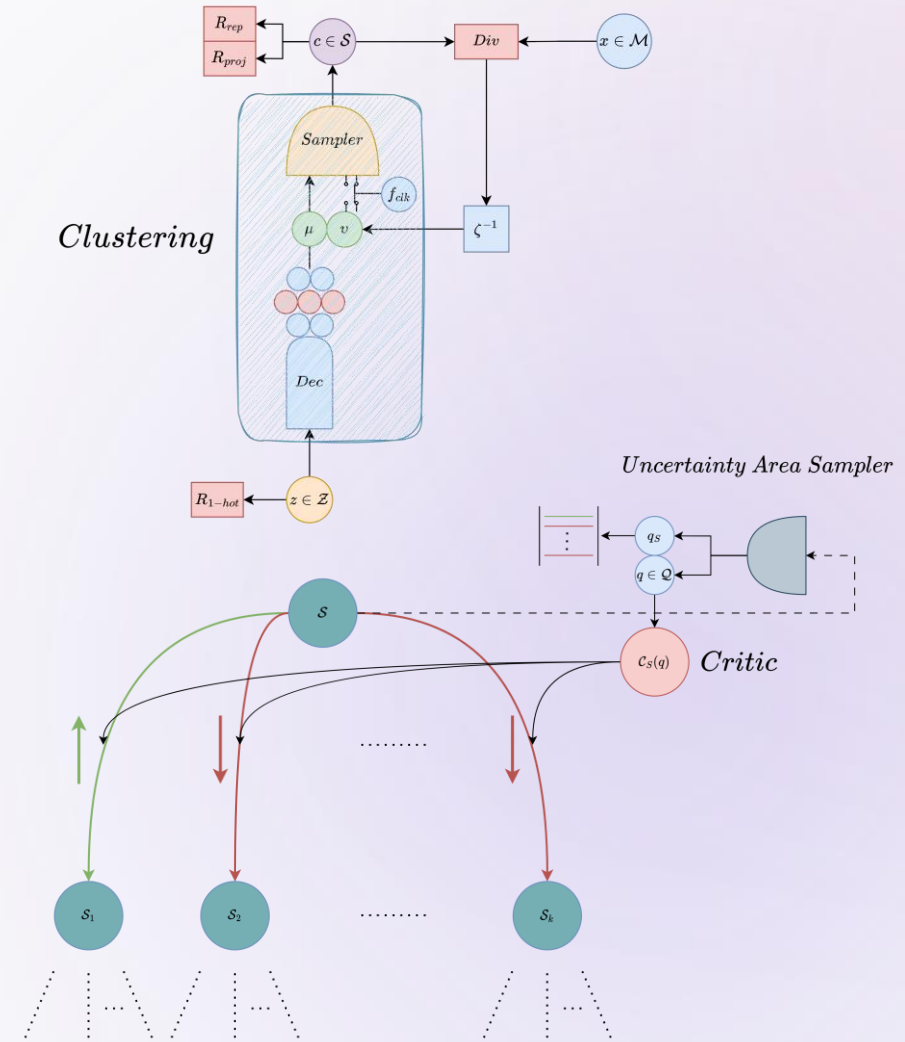

- VLSI: maximum empty cube
- Robotics: path planning

# GeoCluster Architecture

GeoCluster consists of two models:

- **Clustering**  
aims to partition the data space
- **Critic**  
aims to preserve the isometric properties of the original space

# GeoCluster: Clustering

$$V_C = \{v_{c_1}, v_{c_2}, \dots, v_{c_k}\} = \arg \min_C \sum_{i=1}^n \min_{c_j \in C} d(x_i, c_j)$$

$$v_{c_i} = \{x \in S \mid \forall j \neq i, d(x, c_i) < d(x, c_j)\}$$

$$V_D = \{v_{d_1}, v_{d_2}, \dots, v_{d_k}\}$$

$$v_{d_i} = \{x \in S \mid \forall j \neq i, d(x, d_i) < d(x, d_j)\}$$

# GeoCluster: Hierarchical Clustering

# GeoCluster: Uncertainty Area Sampler

$$\tilde{V}_C = \{\tilde{v}_{c_1}, \tilde{v}_{c_2}, \dots, \tilde{v}_{c_k}\}$$
$$\tilde{v}_{c_i} = \{(x, \mu_{c_i}(x)) \mid x \in S\}$$

$$\{\tilde{x}_i\}_{i=1}^m \sim \text{Uniform}(\tilde{V}_C)$$

$$\{y_i\}_{i=1}^M, \text{ such that } \forall i \in \{1, \dots, M\}, \exists j \in \{1, \dots, k\},$$

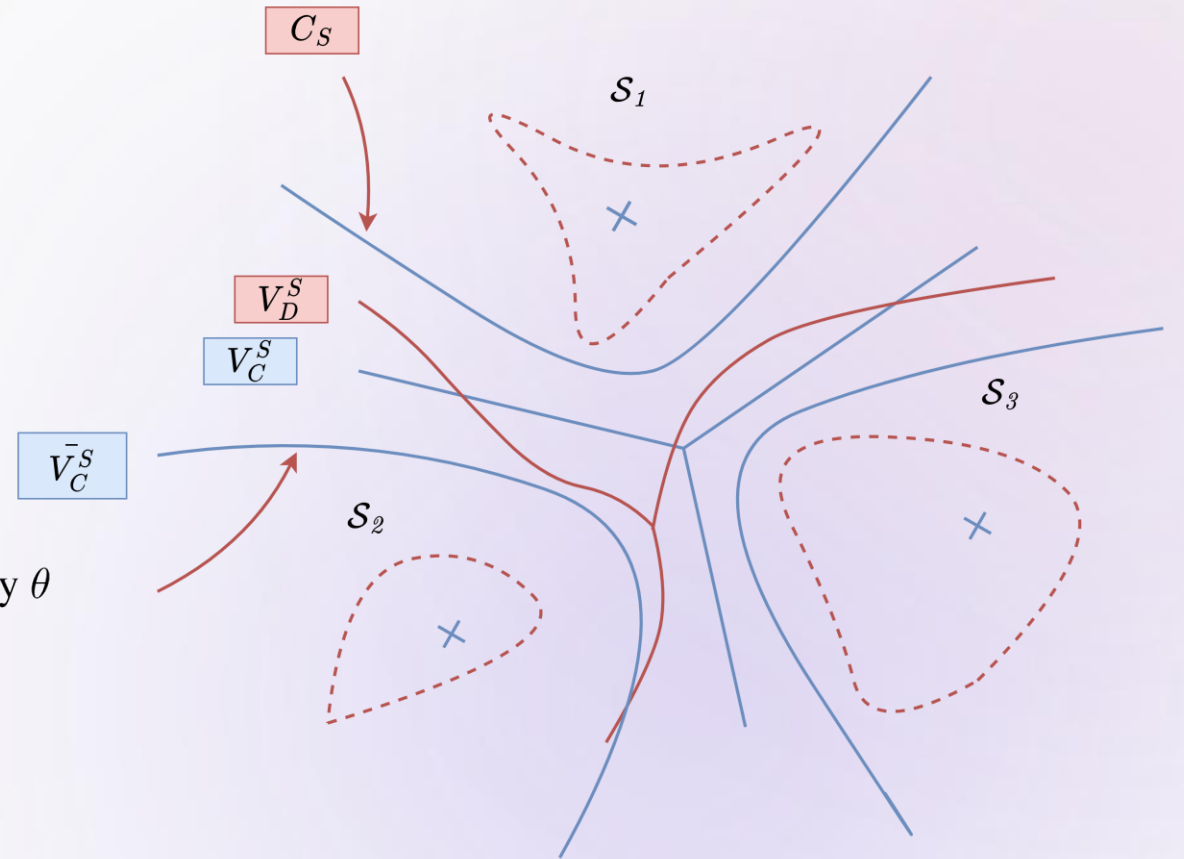

where  $y_i = j$  if  $x_i \in v_{d_j}$

# GeoCluster: Critic

$$C_S = \arg \min_{\theta} \sum_{i=1}^m L(f_{\theta}(\tilde{x}_i), y_i)$$

- $\theta$  are the parameters of the critic neural network
- $f_{\theta}(\cdot)$  represents the critic neural network's function, parameterized by  $\theta$
- $y_i$  is the true label of  $\tilde{x}_i$  according to  $V_D$
- $L$  is a loss function

# Results: Accuracy & Efficiency

	Layer 1-2	Layer 2-3	Layer 3-4	Layer 4-5	Layer 5-6	Dimensions	Metric
Squares	$82.8 \pm 2.0$	$97.7 \pm 0.7$	$99.8 \pm 0.2$	-	-	$\mathbb{R}^2$	$L_\infty$
Cuboids	$91.3 \pm 0.8$	$87.9 \pm 1.4$	$90.5 \pm 2.4$	$93 \pm 2.2$	$99.3 \pm 0.7$	$\mathbb{R}^3$	$L_\infty$
Ellipses	$95.7 \pm 0.6$	$95.2 \pm 1.1$	$97.7 \pm 0.9$	-	-	$\mathbb{R}^2$	$L_2$

	<i>Top 1</i>	<i>Top 2</i>	<i>Top 5</i>	<i>Top 10</i>	<i>Top 1%</i>	<i>Top 5%</i>	<i>Top 10%</i>
Squares	$77.3 \pm 2.3$	$79.1 \pm 1.8$	$81.7 \pm 2.4$	$83.4 \pm 2.1$	$90.9 \pm 2.0$	$99.7 \pm 0.3$	$99.9 \pm 0.1$
Cuboids	$61.9 \pm 2.0$	$73.3 \pm 1.6$	$85.3 \pm 2.0$	$91.0 \pm 1.2$	$99.0 \pm 0.7$	100	100
Ellipses	$76.9 \pm 1.6$	$79.3 \pm 1.7$	$81.5 \pm 1.8$	$83.8 \pm 2.1$	$91.0 \pm 0.9$	$98.4 \pm 0.1$	$99.6 \pm 0.4$

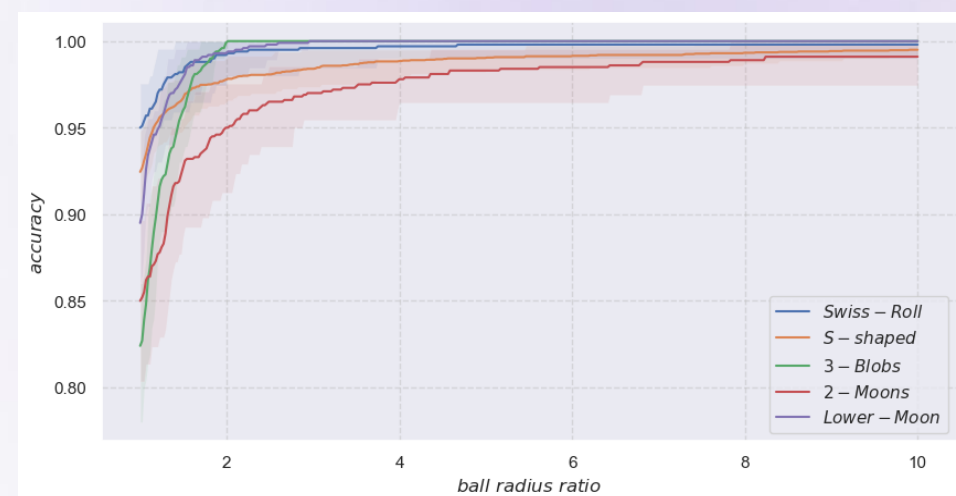

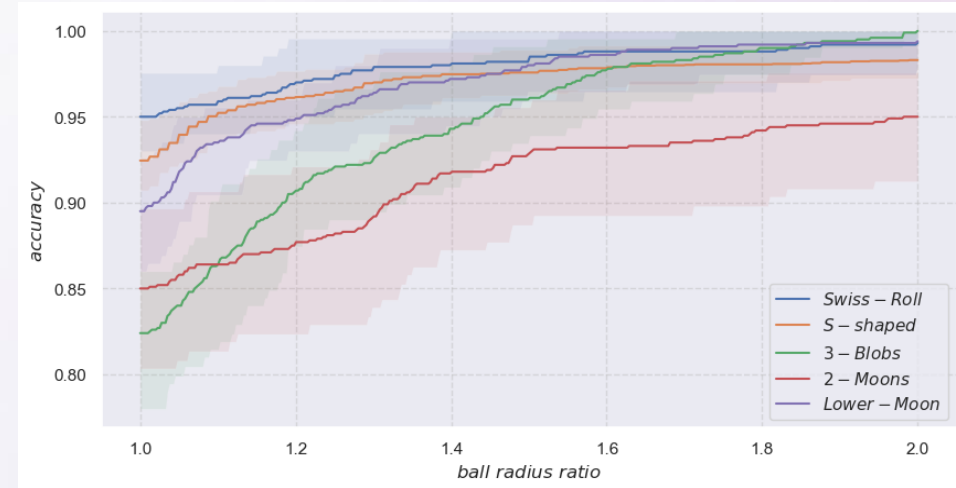

# Results: Accuracy & Efficiency

Continuous Soft-Accuracy, “*is our NN a good candidate, in terms of distance*”, measured for differently distributed 2D rectangles:

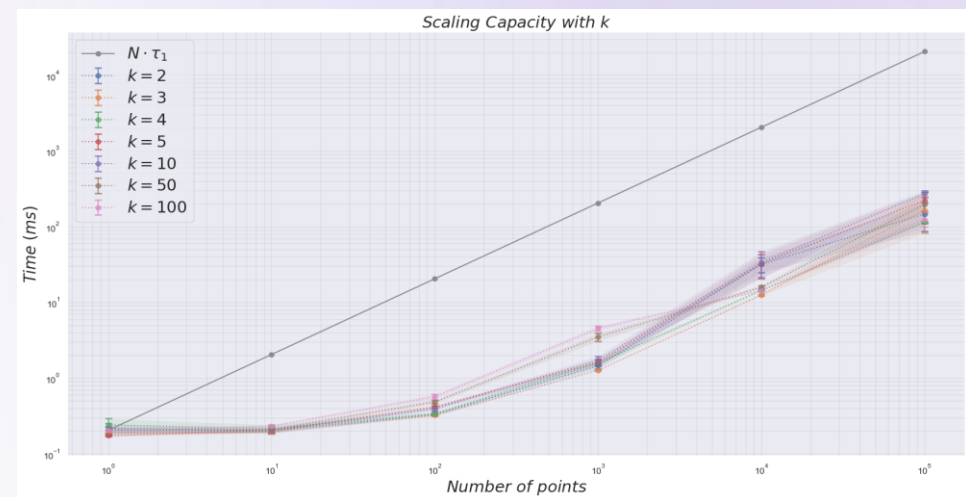

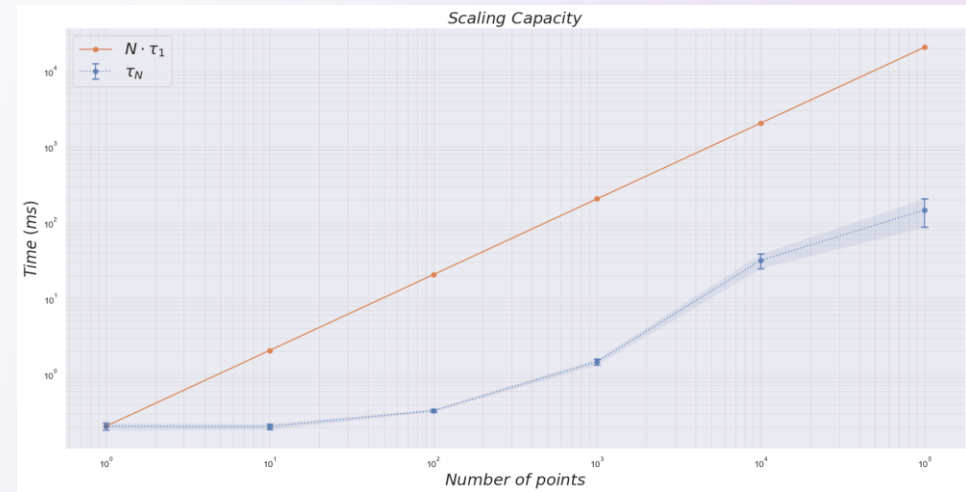

- Structure complexity does not decrease accuracy
- Complexity related decrease, converges @ ball = 2
- Data density seem to play a role

# Results: Accuracy & Efficiency

Experimental average complexity is measured for  $N$  queries and  $m$  data:

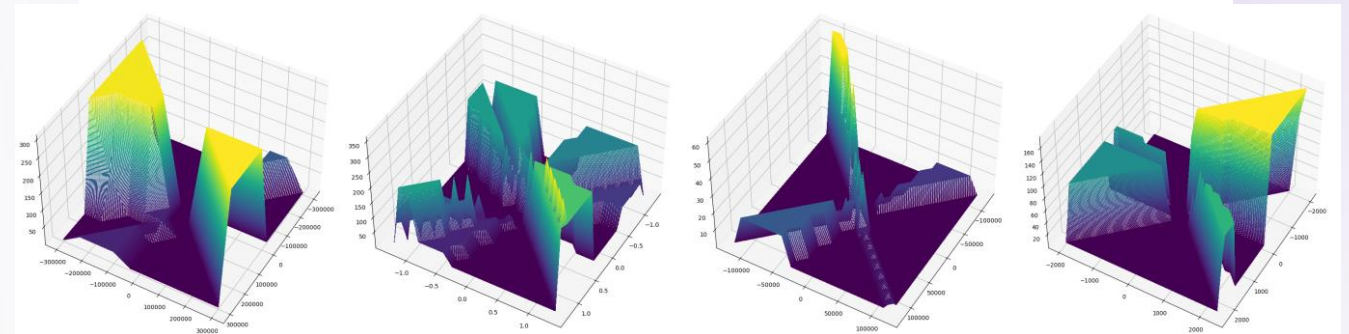

- $N\tau_1 \rightarrow O(N \log_k m)$
- $\tau_N \ll N\tau_1 \rightarrow O\left(\left\lceil \frac{N}{p} \right\rceil \log_k m\right), \tilde{p} = 100$   
 $p$  is due to parallelization
- $\tau_{N,1} \approx \tau_{N,k} \forall k \in \{2,3,4,5,10,50,100\}$

# Results: Robustness

We measure the effectiveness of our model in approximating the nearest neighbor in out of distribution and out of manifold queries.

- Accuracy, drops, but converges as we move away
- Data structure seem to play a role in converged accuracy

# Conclusions

- ✓ Clustering to partition space  $S$
- ✓ Critic to preserve nearest neighbor information
- ✓ Hierarchical structure used for parsing
- ✓ Works for different data, metrics, and in 2,3 dimensions
- ✓ Fast due to neural network inherent parallelization abilities

# Thank you
